

EU objectives for biofuels

Alfonso González Finat
European Commission
DG Energy and Transport

8 October 2007

How could this be achieved?

- It is **technically possible** for the EU to produce a 10% share domestically
- This is **not likely** in practice
- Under a **50:50 scenario** (domestic production:imports), we might use 2 – 4 million tons of palm oil

Sustainability

- A concern that is dominating the European debate
- Palm oil at the centre
- The Commission's first ideas:
 - biofuels should deliver **minimum greenhouse gas savings**
 - biofuels should not come from land with **high biodiversity value** or **high carbon stocks**

**Commission to adopt a proposal for a
Directive in December 2007 with the
inclusion of Sustainable Criteria**
